

Import Data Using Transform Maps (Spreadsheet)

5. Project Development Phase

Implementation of the spreadsheet import and Transform Map

Step 1 – Prepare Spreadsheet

Create a clean spreadsheet with column headings and sample records. Remove unnecessary columns and correct obvious data-format problems.

Step 2 – Load Source Data

Upload the spreadsheet through the import process so that the source records are loaded into an Import Set Table.

Step 3 – Configure Transform Map

Create a Transform Map and select the appropriate target table. Define the source-to-target field relationships.

Step 4 – Configure Field Mapping

Map each source column to the corresponding target field. Add transformation logic where direct mapping is not sufficient.

Step 5 – Run Transformation

Execute the transformation so that source records are processed and transferred to the target table.

Step 6 – Verify Records

Open the target table and compare imported records with the original spreadsheet to confirm that the values were transferred correctly.

Project: Import Data Using Transform Maps (Spreadsheet)
