

Import Data Using Transform Maps (Spreadsheet)

6. Project Testing

Testing the import process, mappings, transformations and error handling

Test Case 1 – Valid Data

Upload a spreadsheet containing valid records. Expected result: records are imported into the target table correctly.

Test Case 2 – Missing Mandatory Field

Use a record with a required field missing. Expected result: the record is rejected or handled according to the configured validation rules, and the error can be identified.

Test Case 3 – Incorrect Data Format

Use an invalid date or incompatible value. Expected result: the transformation should flag or handle the invalid data rather than silently producing incorrect information.

Test Case 4 – Field Mapping

Check each source column against its target field. Expected result: values appear in the correct target fields.

Test Case 5 – Transformation Logic

Provide source values that require conversion. Expected result: the target table contains the correctly transformed values.

Test Case 6 – Duplicate Data

Import a duplicate or matching record according to the project's identification rule. Expected result: duplicate handling works as designed.

Testing Result

The final result should confirm successful records, identify failed records and demonstrate that the Transform Map performs the intended data movement and transformation.

Project: Import Data Using Transform Maps (Spreadsheet)
