

Import Data Using Transform Maps (Spreadsheet)

7. Project Documentation

Technical and user documentation for the completed project

Project Overview

Import Data Using Transform Maps (Spreadsheet) is designed to move structured spreadsheet data into a target table through an import and transformation workflow.

Configuration Details

Document the source spreadsheet structure, Import Set Table, target table, Transform Map, field mappings, transformation scripts or rules, identification rules and validation settings used in the project.

Procedure

Document the complete procedure from preparing the spreadsheet through uploading, transforming, checking import results and correcting failed records.

Screenshots to Include

Recommended screenshots: sample spreadsheet, import configuration, Import Set Table, Transform Map configuration, field mappings, transformation result, target records and error/log view.

Maintenance

Future changes to spreadsheet columns or target fields should be reviewed before importing. Mapping and transformation logic should be updated whenever the source or target structure changes.

Conclusion

The documentation provides a repeatable reference for configuring, operating, testing and maintaining the spreadsheet import workflow.
