

Import Data Using Transform Maps (Spreadsheet)

8. Project Demonstration

Demonstration flow for presenting the completed Transform Map project

Introduction

Introduce the project as 'Import Data Using Transform Maps (Spreadsheet)'. Explain the problem of manual data entry and the purpose of automating spreadsheet data transfer.

Demo Part 1 – Source File

Show the sample spreadsheet and explain the important columns and records.

Demo Part 2 – Import Configuration

Show how the spreadsheet data is loaded and how the Import Set Table receives the source records.

Demo Part 3 – Transform Map

Show the Transform Map, target table and field mappings. Explain any transformation rules used.

Demo Part 4 – Run Import

Run the transformation and show the import result. Explain how successful and failed records are identified.

Demo Part 5 – Verify Output

Open the target table and compare selected records with the spreadsheet to demonstrate correct data transfer.

Key Benefits

The project demonstrates reduced manual data entry, structured field mapping, repeatable data transformation, easier validation and better consistency of imported records.

Conclusion

Conclude by explaining that the Transform Map connects the source spreadsheet structure with the target table and provides controlled data transformation during import.

Project: Import Data Using Transform Maps (Spreadsheet)
